

Accessories The Power within

1. UNLOADER VALVE & TRIGGER OPERATED GUN

Since vehicle cleaning isn't a continuous process, when you don't want flow of water, pump needs to be turned off to save power and water. But to turn on & off the pump frequently, will invite frequent maintenance.

The trigger gun with unloader provides a kind of control, literally at the operator's fingertips to save the power and water.

As trigger gun is released to shut off the flow of water, unloader start diverting water at almost no pressure to inlet source resulting into almost 70% power and 100 % water saving !!

2. GUN WITHOUT TRIGGER

Basic gun without trigger, which is economical and ready to work in any condition due to its simplicity. However, it can't save water & electricity.

3. LANCES

To maintain distance between article & operator Lance is useful accessory. Apart from standard size of 300, 500 and 800 mm, the special sizes are also available.

4. CONVENTIONAL NOZZLES

1) Straight Jet (0°): It is also known as solid jet. This jet gives high impact and removes muddy and clumsy solid particles from the surface.

2) Angular Jet (5°): This type of jet covers larger surface area. It reduces impact of water jet at same pressure.

5. DOUBLE NOZZLE HOLDER

It is a holding device to hold two different conventional nozzles. The benefit is to clean with straight jet & to wash with angular jet, without changing nozzles. This is rugged and maintenance free device.

6. VAN-VARIABLE ANGLE NOZZLE

With this nozzle, 0° to 30° angle of jet can be achieved just by rotating nozzle casing. This is very useful and economical nozzle but it is sand sensitive.

7. THREE-WAY NOZZLE

Multi purpose combination of nozzles that can generate straight jet & angular jet of 15° and 30° at different pressure. Nozzle(s) can be operated simultaneously or at a time. Washing & cleaning can be achieved together with this unique nozzle with high degree of power saving.

8. PRESSURE ADJUSTING NOZZLE HOLDER

A unique holding device for conventional nozzle, acts as a pressure regulator and allows straight as well as cone type spray. Mechanism of the holder will divert a part of the flow through periphery, makes the flow cone type at reduced pressure on rotating the casing. Power saving & better cleaning by same conventional nozzle can be achieved with the help of this accessory.

9. PIPE / DRAIN CLEANING NOZZLE

It is used for cleaning of pipe and small drainage line.

10. SECURITY VALVE

Tiny solid particles may chock up the gun, unloader valve or nozzle will cause infinite high pressure. This is a dangerous situation for the pump system and even for human being. The security valve will open whenever the pressure of the pump will increase beyond the set level and will prevent any possible accident.

11. HOSE PIPE

PressureJet supplies high strength, low weight, erosion resistant hose-pipe of reputed make.
